Revision History

Version	Date of Publication	Reason for Change	Author
V1	16 Jan 2014	Initial publication	Stephen Hambleton
V2	2 Apr 2014	Details added: Daily BAR rates beyond IDeaS' BAR Window. Added clarity to Daily BAR calculation document	Stephen Hambleton
V3	30 Apr 2014	Correction in FPLOS section	Stephen Hambleton
V4	16 Jun 2014	Added note on Advanced Dynamic Base Rates	Stephen Hambleton
V5	16 Jul 2014	Addition of notes for IDeaS G3 RMS	Stephen Hambleton

Version	Date of Publication	Reason for Change	Author
V6	30 Sep 2014	Updated notes on G3 RMS (LRV)	Stephen Hambleton
V7	15 Oct 2014	Updated notes on Master Class	Stephen Hambleton
V8	02 Dec 2014	Minor changes Ref. G3 RMS	Stephen Hambleton
V9	24 Feb 2015	Changes to Yield category configuration and Room Type assignment sections for IDeaS G3 RMS	Stephen Hambleton
V10	9 Jun 2015	Added considerations for BAR FPLOS by Rate Plan by Room Type	Stephen Hambleton
V11	1 Sep 2015	Added note on the maximum characters in the Yield Category Configuration for IDeaS G3 RMS	Stephen Hambleton
V12	23 Dec 2015	Updated Notes on Daily Rates/ Daily BAR with the BBAR Parameter active and also Derivative Rate advice based on client feedback	Stephen Hambleton
V13	29 Apr 2015	Added note on Inventory re-synchronization	Stephen Hambleton
V14	14 Oct 2017	Added notes on Component Rooms. Revised content to reflect Rooms Configuration Added notes related to different types of BAR FPLOS deployment. Added notes on deploying MInLOS or FPLOS to OPMS.	Stephen Hambleton

Configuration Checklist

Below is a summary of the configuration items you will be required to complete prior to decision upload. The steps are specified by IDeaS system type.

Item	Done?	RMS	PS	Notes
Selection of a BAR Type	☐	☒	☒	If using IDeaS RMS it is essential to choose the correct BAR type for your business. For IDeaS PS this will be defined as Daily BAR.
System Parameters for BAR	☐	☒	☒	
BAR Rate Code(s) Configuration	☐	☒	☒	
Derivative Rate Code(s) Configuration	☐	☒	☒	
LRV System Parameter(s) Configuration	☐	☒	☐	
LRV Room Type Configuration	☐	☒	☐	Yield Status of each Room Type
LRV Rate Code Configuration	☐	☒	☐	Yield Status of each Rate Code
LRV: Yieldable Costs & Values	☐	☒	☐	This is known as Yield Adjustments in Opera products
Overbooking System Parameters Configuration	☐	☒	☐	
Clear Out Manual Decisions	☐	☒	☒	If you have been manually applying decisions or rates & restrictions in your selling system please ensure you remove these following validation of successful decision upload from IDeaS RMS

Introduction

This document is designed to support your configuration of Opera PMS/ORS to enable IDeaS decision upload from IDeaS Pricing System (PS), IDeaS Revenue Management System (RMS) or IDeaS Generation 3 (G3) RMS.

This document is for reference only, it is not intended as a document which should be read through in its entirety – please refer to those sections which are relevant for you. Your IDeaS client representative will suggest the specific sections of the document which are relevant for you.

Disclaimer

It is important to note that this documentation is not intended to replace support from your selling system vendor and that these documents contain the required configuration steps to support decision upload from IDeaS products to the best of IDeaS' knowledge. The contents of these documents may become outdated or may change without notice should functionality within the selling system change. IDeaS Revenue Solutions does not support third party products and takes no responsibility for the configuration of these systems nor any problems which arise as a result of any configuration changes in third party systems. This documentation is purely to help support the configuration required to facilitate decision upload from IDeaS products.

Pre-Requisites

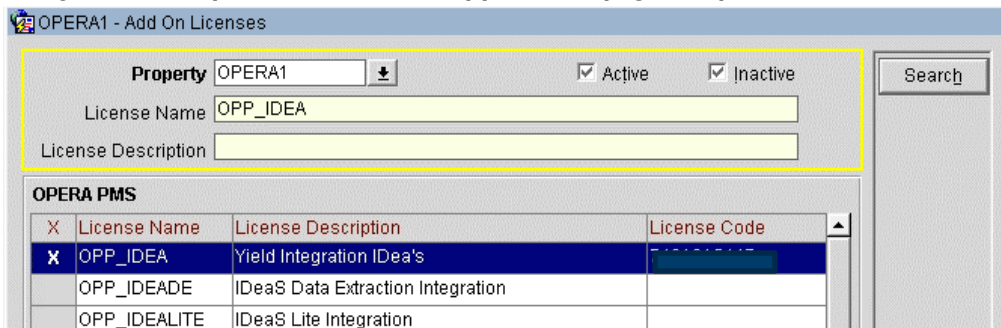

Please note that for Opera PMS (OPMS) to be able to accept IDeaS decision upload the following licenses must be active (as appropriate):

- ◆ **OPP_IDEA - Yield Integration IDeaS**
 - » This license enables LRV/Opera Hurdle & BAR Rate uploads
 - » This is required for IDeaS RMS decision upload.
- ◆ **OPP_IDEALITE - IDeaS Lite Integration License**
 - » This license enables Daily Rates (Daily BAR) uploads only
 - » This is required to support IDeaS Pricing System decision upload.

To check what licenses are active for your property please follow the steps below:

Open the Configuration module from the login screen: 

Navigate to: **Setup>License Codes>Application (e.g. PMS) >Add on License:**

OPERA1 - Add On Licenses

Property: OPERA1 ☐ Active ☐ Inactive

License Name: OPP_IDEA

License Description:

OPERA PMS

X	License Name	License Description	License Code
X	OPP_IDEA	Yield Integration IDea's	
	OPP_IDEADE	IDeaS Data Extraction Integration	
	OPP_IDEALITE	IDeaS Lite Integration	

The minimum version of Opera products for IDeaS G3 RMS integration is 5.0.03.03 e-patch 25.

Note for IDeaS Pricing System

The only section of this document relevant to IDeaS Pricing System Decision Upload is the “Configuration of Daily BAR” section. Daily BAR Rates by Room Type are the only decisions IDeaS Pricing System will deliver into Opera products.

Decision Upload Capabilities

Opera products support the following controls & capabilities from IDeaS Systems:

Decision	Support	Notes
BAR by LOS	☒	BAR by LOS is delivered in one of 2 formats – the type of delivery depends upon your requirements for the use of BAR derivative rate codes. Please see the section on BAR by LOS for further clarification.
Daily BAR (Known as Daily Rates in Opera Products)	☒	Daily BAR Decisions are delivered by sending a rate value for each stay date by room type to a designated Daily Rate Code. Note: Version 5.0.01.04 of the OPERA PMS, ORS and myfidelio.net (if applicable) or higher is required.
LRV by Hotel with Deltas	☒	IDeaS LRV is uploaded as an Opera Hurdle Value along with a Delta, Ceiling and Max Sold value for each stay date by room type.
LRV by Room Type with Deltas	☒	Optimized at Room Class Level in G3 and delivered by Room Type as per the Room Class: Room Type mapping In G2 decisions for specific Room Types may be adjusted where a specific business requirement exists.
House Level Overbooking	☒	IDeaS Hotel Level Overbooking decisions are uploaded as House Level Overbooking Limits in OPMS.
Room Type Overbooking	☒	IDeaS Room Type Level Overbooking decisions are uploaded as Room Type Overbooking Limits in OPMS.
Yield Currency	☒	If required: For Properties working with multiple currencies, Opera's Currency Exchange API allows IDeaS RMS to extract currency exchange information from Opera. Version: OPMS /ORS Version 5.0.03.01 or above.
MinLOS for Specific Yieldable Rate Codes (Min Stay in OPMS)	☒	If required: IDeaS translation of Last Room Value into MinLOS or FPLOS using the Restriction Configuration Module Note: no configuration requirements other than ensuring that Minimum Stay Through Restriction are active – see steps on p13
FPLOS (LOSNA in OPMS) for Specific Yieldable Rate Codes	☒	required: IDeaS translation of Last Room Value into MinLOS or FPLOS using the Restriction Configuration Module Note: no configuration requirements other than ensuring that LOSNA restrictions are active – see steps on p13

BAR Configuration

This section covers the configuration required to support BAR uploads from IDeaS products.

IDeaS can upload either **Daily BAR** or **BAR by LOS** decisions into Opera products from IDeaS RMS. The only decision which is uploaded by IDeaS Pricing System (PS) is Daily BAR.

The selection of an appropriate BAR type should be discussed with your IDeaS contact.

BAR by LOS Configuration

This section covers the configuration steps involved to enable the upload of BAR by LOS decisions from IDeaS products.

BAR by LOS Options

Please note - there are two possible BAR by LOS upload formats which can be used with IDeaS Decision Upload in general. The types of deployment and reasons for selection are detailed below:

BAR Type in OPMS	Decision Deployment Method	Notes
Best Available Rates by LOS	BAR by LOS by Day Decisions	Only available at hotel level (G2 RMS). Some limitations in support for derivative rates.
Best BAR by Day	Full Pattern Length of Stay Restrictions (FPLOS)	This method is compatible with derivative rates

BAR by LOS via BAR by LOS Decisions

In this configuration, IDeaS RMS will send controls in a format which defines the BAR rate by arrival rate and LOS.

BAR by LOS by Day Example Controls

```
<BARRateReport RatePlan="BARLVL06" Rate="389.0" LOS="1" ArrivalDate="2014-03-06"/>
<BARRateReport RatePlan="BARLVL06" Rate="389.0" LOS="2" ArrivalDate="2014-03-06"/>
<BARRateReport RatePlan="BARLVL05" Rate="349.0" LOS="3" ArrivalDate="2014-03-06"/>
<BARRateReport RatePlan="BARLVL04" Rate="319.0" LOS="4" ArrivalDate="2014-03-06"/>
<BARRateReport RatePlan="BARLVL04" Rate="319.0" LOS="5" ArrivalDate="2014-03-06"/>
<BARRateReport RatePlan="BARLVL03" Rate="289.0" LOS="6" ArrivalDate="2014-03-06"/>
<BARRateReport RatePlan="BARLVL03" Rate="289.0" LOS="7" ArrivalDate="2014-03-06"/>
<BARRateReport RatePlan="BARLVL03" Rate="289.0" LOS="8" ArrivalDate="2014-03-06"/>
```

The above instructions in the IDeaS decision files define the rates for the 6th of March 2014 as follows in OPMS:

1. For a 1 or 2 night stay Rate Code: BARLVL06 should be offered,
2. For a 3 night stay Rate Code: BARLVL05 should be offered,
3. For a 4 or 5 night stay Rate Code: BARLVL04 should be offered,
4. For a stay of 6 or more nights Rate Code: BARLVL03 should be offered

Note for IDeaS G3 RMS

IDeaS G3 RMS optimizes BAR decisions at the Room Class Level (groups of similar room types). In Opera Products BAR by LOS deployment does not support a decision at the Room Class or Room Type level, therefore IDeaS decisions would be made backwards compatible using the “[Master Class](#)” functionality in IDeaS G3 RMS.

Best BAR by Day – BAR by LOS via FPLOS

Using this configuration; IDeaS RMS will send controls in a Full Pattern Length of Stay Format (FPLOS) which will open and close rate codes based on a specific rate code name in OPMS; for this reason an exact naming match is required.

Important Note: Please discuss the type of BAR FPLOS desired – either BAR FPLOS by hierarchy or Traditional BAR FPLOS with your primary IDeaS contact. This selection is important, particularly if there are non-Opera systems (OPMS/ ORS/ MyFidelio) being used in your distribution environment.

BAR FPLOS by Hierarchy

In the Best BAR by Day environment FPLOS controls work in a hierarchy model based on the value of the BAR rate plans in the BAR spectrum. This means that any BAR rates lower than the BAR rate which is recommended for sale is closed and any with a value equal to or greater than the IDeaS rate decision is open for sale.

The BEST BAR BY DAY Opera functionality by design then ensures that the lowest Room Type & BAR rate code combination is displayed in the Rate Query.

FPLOS by Hierarchy Example Controls

5. There are 5 levels in the BAR spectrum and the value of BAR level 1 is the highest in value
6. The BAR decisions are as follows for a given arrival date are as follows
 - LOS1 = BAR1
 - LOS2 = BAR1
 - LOS3+ = BAR2
7. The controls sent using FPLOS by Hierarchy are as follows:

	LOS						
	1	2	3	4	5	6	7
BAR5	N	N	N	N	N	N	N
BAR4	N	N	N	N	N	N	N
BAR3	N	N	N	N	N	N	N
BAR2	N	N	Y	Y	Y	Y	Y
BAR1	Y	Y	Y	Y	Y	Y	Y

Notes

Using this methodology, should the LRV rise to a level where it is higher than the BAR rate on sale the rate above that rate in the BAR spectrum would then be available for sale. For example – using the example above: If the LRV rises to a level above the value

of BAR 2 for a 3 night stay (e.g. due to the effect of deltas), the BAR1 rate would then be offered instead.

Traditional FPLOS

IDeaS is also able to offer a full Traditional FPLOS deployment methodology for decision uploads.

Using the same example above – instead of BAR1 being left available in the FPLOS restrictions, all rates other than the rates selected for sale for the given arrival date and LOS would be set to unavailable.

Traditional FPLOS Example Controls

1. There are 5 levels in the BAR spectrum and the value of BAR level 1 is the highest in value
2. The BAR decisions are as follows for a given arrival date are as follows
 - LOS1 = BAR1
 - LOS2 = BAR1
 - LOS3+ = BAR2
3. The controls sent using FPLOS by Hierarchy are as follows:

	LOS						
	1	2	3	4	5	6	7
BAR5	N	N	N	N	N	N	N
BAR4	N	N	N	N	N	N	N
BAR3	N	N	N	N	N	N	N
BAR2	N	N	Y	Y	Y	Y	Y
BAR1	Y	Y	N	N	N	N	N

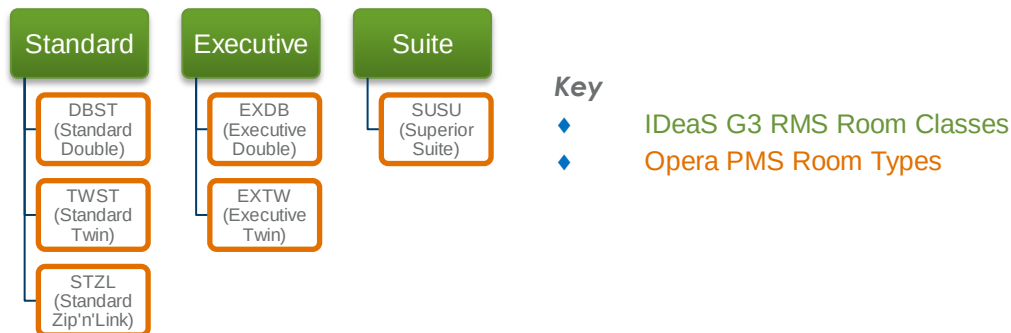

The controls highlighted in orange above are different to the first example.

Note for IDeaS G3 RMS

In IDeaS G3 RMS it is possible for FPLOS controls to be deployed by Rate Plan by Room Type, to enable the BAR by LOS by Room Class decisions to be implemented in Opera products.

Example: Room Class Configuration

The Room Class configuration for a hotel is as follows:

Example Decision Deployment

1. The BAR decisions are as follows for a given arrival date are as follows

LOS	Standard	Deluxe	Suite
1	BAR2	BAR2	BAR1
2	BAR3	BAR2	BAR1
3	BAR4	BAR3	BAR2
4+	BAR4	BAR3	BAR2

2. The FPLOS restrictions deployed to Opera to achieve this would be as follows
(NB – these are generally deployed as Traditional FPLOS and not by hierarchy although the hierarchy option can still be offered):

Rate Plan	Room Type(s)	LOS						
		1	2	3	4	5	6	7
BAR1	DBST, TWST & STZL	N	N	N	N	N	N	N
BAR2	DBST, TWST & STZL	Y	N	N	N	N	N	N
BAR3	DBST, TWST & STZL	N	Y	N	N	N	N	N
BAR4	DBST, TWST & STZL	N	N	Y	Y	Y	Y	Y
BAR5	DBST, TWST & STZL	N	N	N	N	N	N	N
BAR1	EXDB, EXTW	N	N	N	N	N	N	N
BAR2	EXDB, EXTW	Y	Y	N	N	N	N	N
BAR3	EXDB, EXTW	N	N	Y	Y	Y	Y	Y
BAR4	EXDB, EXTW	N	N	N	N	N	N	N
BAR5	EXDB, EXTW	N	N	N	N	N	N	N
BAR1	SUSU	Y	Y	N	N	N	N	N
BAR2	SUSU	N	N	Y	Y	Y	Y	Y
BAR3	SUSU	N	N	N	N	N	N	N
BAR4	SUSU	N	N	N	N	N	N	N
BAR5	SUSU	N	N	N	N	N	N	N

F5 Rate Query

As a result of the controls sent there will be a single prevailing BAR rate code for any arrival date and LOS combination which you query using the F5 Rate Query screen:

OPERA1 - Rate Query Details
Tuesday, February 17, 2009, 1 Nights, 1 Rooms, 2 Adults, 0, 0, 0

Test 10,

Room Types	SKC	SKG	SDC	SDG	A1B	A2B	A3B	PH

System Parameters

To support configuration, upload and use of IDEaS **BAR by LOS in the FPLOS by Hierarchy** format, the BAR Type: **“BEST BAR BY DAY” (BBAR)** should be selected.

- ◆ Best BAR by Day (BBAR) functionality is intended to return the lowest available BAR rate value by room type when a rate query (F5) is run for a given arrival date and LOS.

To support configuration, upload and use of **BAR by LOS decisions in a LOS format** the BAR type **“BAR BY LOS”** should be selected

- ◆ When BAR by LOS is selected; the Best Available Rate will be set based on the arrival date and Length of Stay queried. Only one rate code is defined as the BAR on sale for any given arrival date and LOS depending upon the IDEaS decisions. The Rate Query screen will show a single rate per room type as the Best Available Rate.

Please note: if you are un-sure which format the BAR decision upload will be in please discuss this with your IDEaS contact.

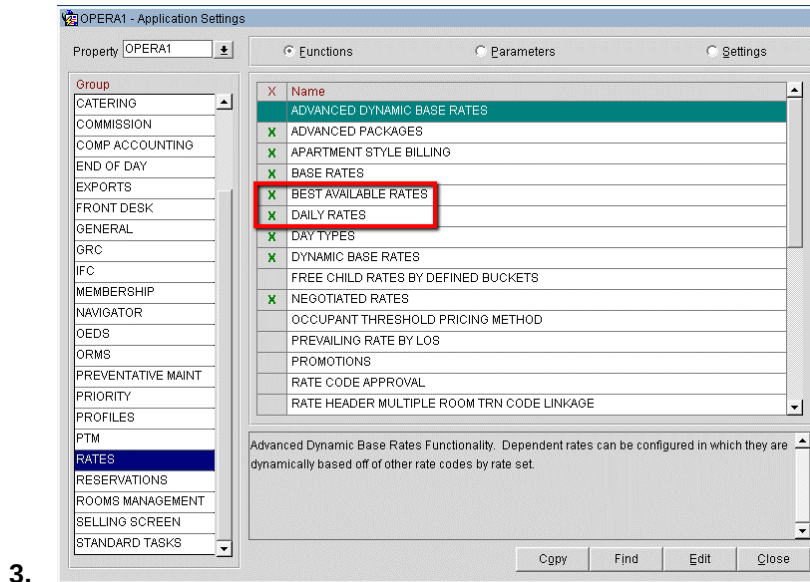

Application Settings to Activate

1. Open the PMS module from the login screen:
2. Navigate To: Setup > Application Settings > Function > Rates

Ensure the two functions below are active:

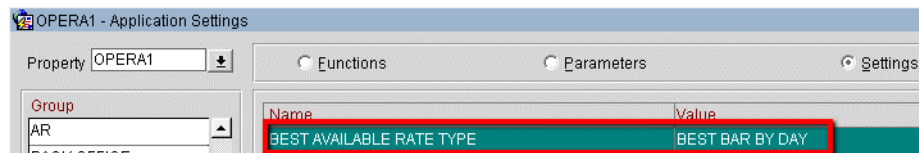

- BEST AVAILABLE RATES
- DAILY RATES (**only** where you will be uploading **Daily BAR** decisions)

Whilst still within the Application Settings Dialogue Box (above)

When Using Daily BAR or BAR by LOS via FPLOS

3. **Click:** Settings > Rates > Best Available Rate Type > Edit
 - a. **Select:** BEST BAR BY DAY

- b.
4. **Click:** Restriction Types from the **Group** menu on the left
 - a. **Ensure the following settings are active:**
 - i. "LENGTH OF STAY NA"
 - ii. "STAY THROUGH"

When Using BAR by LOS via BAR by LOS Decisions

5. **Click:** Settings > Rates > Best Available Rate Type > Edit
 - a. **Select:** BAR BY LOS

Configuration of BAR by LOS Rate Codes

This section covers the configuration required to support BAR by LOS uploads from IDEaS products.

Please note this decision output method is suitable for IDEaS RMS decision upload only. IDEaS Pricing System does not support this decision output method.

In a BAR by LOS environment all of the BAR rates created in IDEaS **must** match the BAR rates configured in OPMS.

Rate Mapping Example

Rate Code in OPMS	Rate Plan Name in IDeaS
BAR1	BAR1
BAR2	BAR2
BAR3	BAR3
BAR4	BAR4
BAR5	BAR5
BAR6	BAR6
BAR7	BAR7
BAR8	BAR8

Rate Header | Rate Detail | Negoti

Rate Code BAR1

Rate Plan | Rate Details

Rate Plan :

Rate Name

BAR1

- ◆ The rate value in IDeaS RMS should be net of VAT/Tax and any packages included by default
 - » e.g. if your default rate is Bed & Breakfast the value loaded in IDeaS RMS should be net of tax and breakfast revenue
 - » **Please note:** in some regions where rates are sold net of Tax/VAT the consideration of Tax is not required e.g. The United States.
- ◆ The value in IDeaS RMS should also be based on the most commonly sold room type in the BAR Market Segment Group.

Rate Code Configuration

Please note that the Rate Code configuration steps are the same for both BAR by LOS BAR delivery methods.

Open the Configuration module from the Login Page:

1. **Navigate To:** Rate Management>Rate Classifications>Rate Codes
2. Click on Add

Rate Header Tab

3. Enter the **Rate Code** for the first rate code in your BAR spectrum. Please remember this must exactly match the equivalent BAR rate plan name configured in IDeaS RMS.
4. Enter a **Rate Plan Description**
5. Assign the Rate Code to a **Rate Category**
 - a. It is recommended that the same category e.g. "BAR" is assigned to all BAR rate plans and BAR derivatives (e.g. BAR Bed & Breakfast, BAR Dinner, Bed and Breakfast etc).
6. Enter the **Begin & End Sell Dates**
 - a. The begin sell date must be on or before IDeaS decision upload date
 - b. It is recommended that the end sell date of the rate plan is well beyond the end of the BAR decision window (generally 365 days).
7. Ensure the default **Market Code** is the unqualified/BAR MS code and that this code is mapped correctly to the BAR/Unqualified MSG in IDeaS RMS.
8. It is recommended that the **Display Sequence** is always 1

- a. This means that the prevailing BAR Rate Code will always show first in the Rate Query screen.
9. Assign all **Room Types** which are available as bookable on this rate plan
10. Assign any **Packages** which are included (e.g. Breakfast if it is included in your default BAR configuration – where your BAR rate plans are based on Bed & Breakfast values and not Room Only Values).
 - a. If you do include packages in your rate plans please remember to add any adjustment codes as appropriate (please see the section of this document named “Configuration to Accept Last Room Value (LRV) or Opera Hurdles” for further information.
11. Set Min Stay Through to 1
12. Maximum stay through and all other controls should be blank to allow IDEaS to control this rate code optimally using its decisions.
13. Under the **Components** box please ensure BAR is ticked:

Components	
☐ Package	☐ Day Use
☐ Negotiated	☐ Complimentary
☐ Suppress Rate	☐ House Use
☒ Print Rate	☐ Day Type
☒ Discount	☐ Redemption
☐ Channel Allowed	☒ BAR
☐ Membership	☐ Owner Rate
☐ Daily Rates	

14. Under **Yield**:

- a. Ensure the Yield status = Yieldable

Yield
Yield Status: Yieldable

Rate Detail Tab

15. Click on: **Rate Detail**
16. Define the values by room type for this BAR rate plan as the values you would aim to sell
 - a. Please ensure that the values inclusive of VAT/TAX (where applicable) for the base room type matches the value loaded in IDEaS RMS for this rate plan.
 - i. Example: if the most commonly sold Room Type in the BAR MSG is the Standard Double Room and the value of BAR1 is £400 for this room type; where VAT = 20% the value loaded in IDEaS RMS for BAR1 should be = 333.33.
 - b. If you do not sell inclusive of VAT or in regions e.g. the USA where VAT does not apply then this consideration does not apply.

Next: Repeat steps 2 to 16 until all rate plans have been built as per your BAR rate spectrum.

Notes

- ◆ A single rate code must be configured in OPMS for every BAR Rate Plan you have built in IDEaS RMS
- ◆ All prices by room type should be configured under the Rate Detail tab within the Rate Code Setup dialogue box
- ◆ Please ensure that all rate plans are extended well into the future with the following date range parameters being considered:

BAR Decision Output Window

Begin Sell Date 01/01/14

End Sell Date 31/12/20

On the Rate Detail tab: The longest defined pricing date range is extended well beyond the end of the BAR Decision Output Window

Rate Header	Rate Detail	Negotiated	More		
Start Date 28/01/09 End Date 31/12/20 Start 28/01/09 End 31/12/20 Room Types A1B, A2B, A3B, PH, PM, SDC, SDG, SKG					
Sun Mon Tue Wed Thu Fri Sat ☒ ☒ ☒ ☒ ☒ ☒ ☒ Points Req.					
Amounts 1 Adult 300.00 2 Adult 400.00 3 Adult 500.00 4 Adult 5 Adult Extra Adult		Children on Own 1 Child 2 Children 3 Children 4 Children			
Attributes Market v Source v Room Types A1B, A2B, A3B, PH, PM, SDC, SDG, SKG v Packages v		Total Yield Adjustments Per Stay Per Night Per Person/Stay Per Person/Night			

Daily BAR Configuration

This section covers the calculation involved in Daily BAR decisions by room type and also the steps required to configure Opera to support Daily BAR uploads from IDeaS products.

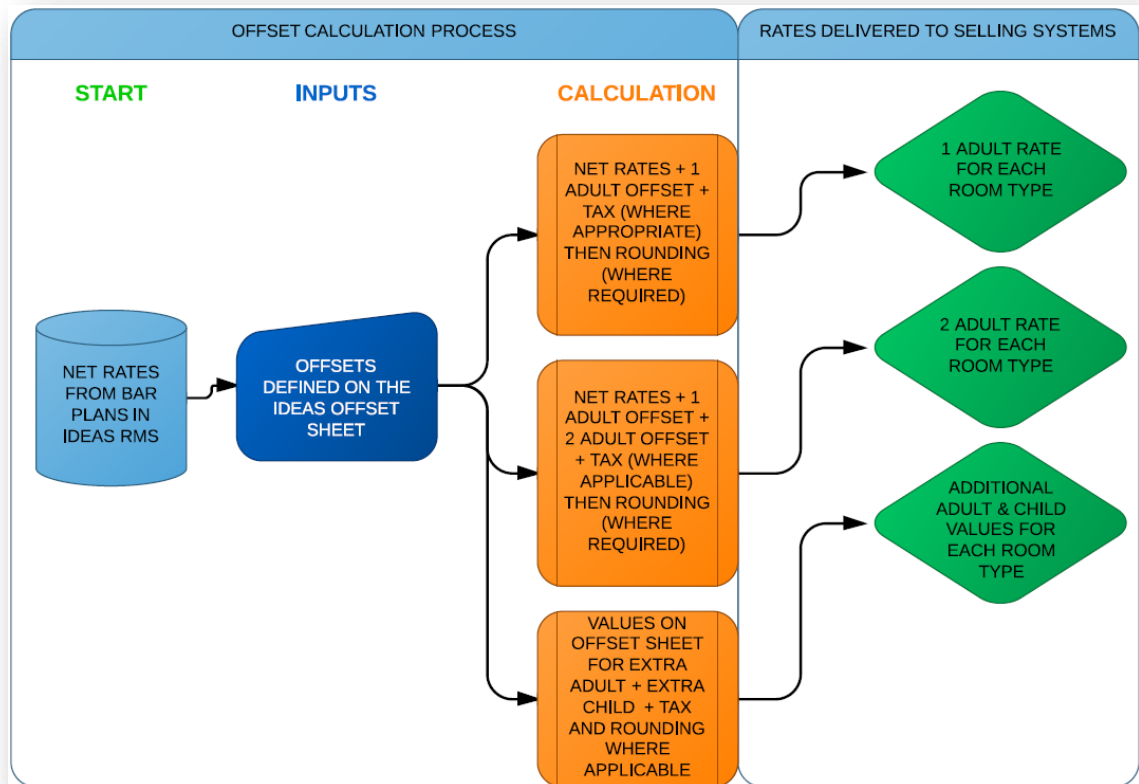

The IDeaS integration for Daily BAR in Opera works via delivery of a Daily Rate value for each arrival date by room type. These values are delivered to a single Daily Rate code in Opera products.

IDeaS requires completion of an offset (supplements) configuration sheet to calculate the Daily BAR values for each room type.

Please note that as Opera works with data net of Tax/VAT and packages all configuration in IDeaS products should also be net of Tax and packages where applicable. If you are working with yield currency this conversion will also be applied to the delivered values.

IDeaS G2 RMS: Daily BAR Calculation Method

The calculation method for Daily BAR decisions is as follows:

Example

The IDeaS BAR decision for today is: BAR1 and the configuration of BAR1 is as below:

	Sun	Mon	Tue	Wed	Thu	Fri	Sat
Value	550.00	550.00	550.00	550.00	550.00	550.00	550.00
Up to %	100.00	100.00	100.00	100.00	100.00	100.00	100.00
Available	Yes	Yes	Yes	Yes	Yes	Yes	Yes

The offsets (net of VAT/TAX and packages) are as follows:

Room Type	1 Adult Offset Type	1 Adult Offset	2 Adult Offset Type	2 Adult Offset
DBST	Fixed	0	Fixed	295.29
DBEX	Fixed	18	Fixed	295.29
SUSU	Fixed	41	Fixed	295.29

The calculation & resulting Daily BAR values would be as follows (where tax = 10%):

- ◆ **Single Occupancy Rate:** A + B + Tax (C) Then rounding = **D**
- ◆ **Double Occupancy Rate:** A + B + E + Tax (F) Then rounding = **G**
- ◆ **Please note:** Yield Currency adjustments would also be applied where applicable for your property.

	A	B	C	D	E	F	G
Room Type	Net Rate	Supplement for Room Type	Value + Tax	Value in Opera for 1 Adult	Additional Supplement for Double Occupancy	Value + Tax	Value in Opera for 2 Adults
DBST	550.00	0.00	605.00	605.00	295.29	929.82	930.00
DBEX	550.00	18.00	624.80	625.00	295.29	949.62	950.00
SUSU	550.00	41.00	650.10	650.00	295.29	974.92	975.00

IDeaS G3 RMS: Daily BAR Calculation Method

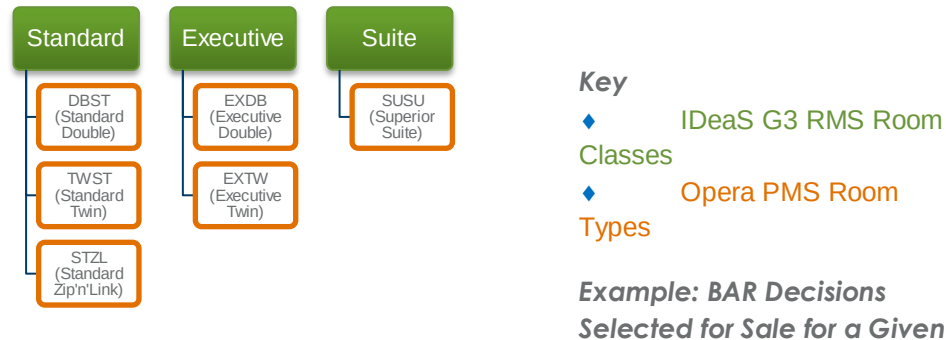

IDeaS G3 RMS optimizes BAR decisions at the Room Class Level (groups of similar room types). If the BAR deployment method selected is Daily BAR then the BAR decisions by Room Type will be delivered relative to the net value for the given Room Type for the BAR rate level selected in the Room Class for that Room Type.

Please note – this applies to both BAR by Day and Continuous Pricing properties – the output to OPMS is the same for both pricing types.

Example

Example: Room Class Configuration

The Room Class configuration for a hotel is as follows:

Date

The BAR rates selected for sale by G3 RMS for a given date are as follows by room class:

Room Class:	Standard	Executive	Suite
BAR Decision:	BAR2	BAR3	BAR3

Example: Net Rates for BAR Levels

The net rate level definition by room type is as follows (by room type):

Room Type	BAR2	BAR3
DBST	90.00	80.00
TWST	90.00	80.00
STZL	90.00	80.00
EXDB	110.00	100.00
EXTW	110.00	100.00
SUSU	190.00	180.00

Note: In Continuous Pricing properties, the only difference from an integration perspective is the absence of BAR levels and the configuration being based on a floor and ceiling

The values defined above would constitute the base rates by room type for the Daily BAR rates delivered to Opera. Where appropriate the calculation would continue as per the G2 calculation diagram (see page 14):

- ◆ 1 or 2 adult offsets would be added as appropriate
- ◆ Tax would be added at the appropriate percentage (where required)
- ◆ Rounding would be added to the decisions (where appropriate)
- ◆ Additional Adult & Child values would be delivered by room type as appropriate

Notes for using Daily Rates in OPMS

- ◆ In the G2 calculation: you will see above there is a room type with a 0.00 offset – this should be the case as this is the calculation for the base room type which the BAR rates are based on in IDeaS RMS

- » This configuration in the RMS should always be based on the most commonly sold room type in the BAR MSG.
 - ◆ If your single occupancy (1 Adult) and double occupancy (2 Adult) rates in OPMS are the same then the 2 adult offset should be 0.00
 - ◆ IDeaS RMS/PS will only be able to define values for those room types with defined offsets on the offset sheet
 - ◆ No more than 10 rate codes should be defined as “Daily Rates” in OPMS
 - ◆ The BAR decision window from IDeaS RMS/PS should not exceed 365 days
- Please note: The last 2 restrictions are recommended by Micros to prevent performance limitations in the Opera product suite.

System Parameters

To support configuration, upload and use of IDeaS **Daily BAR** format, the BAR Type: **“BEST BAR BY DAY” (BBAR)** is recommended but not required (Daily Rates is the Required OPMS/ ORS Function).

- ◆ Best BAR by Day (BBAR) functionality is intended to return the lowest available BAR rate value by room type when a rate query (F5) is run for a given arrival date and LOS
- ◆ Whilst this functionality is not required it will support the availability of the “BAR Based” derivation methodology for derived rates and also the single Best Available Rate display in the F5 Rate Query process, where Best Available is checked

Application Settings to Activate

6. Open the PMS module from the login screen:
7. Navigate To: Setup > Application Settings > Function > Rates

Ensure the two functions below are active:

- BEST AVAILABLE RATES
 - DAILY RATES (**only** where you will be uploading **Daily BAR** decisions)
8. Navigate to: Setup > Application Settings > Settings > Rates
 - a. Review the value within the Application Setting “DAILY RATES MAX DAYS”
 - b. By Default this parameter is set to 396. This means that if you define a BAR value outside of the Daily BAR window defined by IDeaS then this value will be put on sale up to the 397 days in the future.
 - c. When setting this parameter you should consider the following:
 - i. If you do wish to sell rates beyond the 365 day BAR window from IDeaS then this should be set to the number of days in the future you wish to sell for – 1 day
 - ii. If you do not wish to sell rates beyond the 365 day BAR window from IDeaS then this should be set to 364. The reason for this is that Opera products count the first future sale date from tomorrow therefore 365 would actually be 366 days on sale.

Rate Code Configuration

Open the Configuration module from the Login Page:

Navigate To: Rate Management>Rate Classifications>Rate Codes

1. Click on Add
2. You must set-up a single designated Daily BAR Rate Code to support decision upload.

Rate Header Parameters

Rate Code: The Rate Code used must match the Rate Code given to IDeaS on the Offset Sheet

Begin Sell Date: This must be equal to the decision upload date or earlier.

End Sell Date: This should be extended well into the future (as a minimum it must always cover the entirety of the BAR decision window).

Market Code: Should be mapped to the Unqualified MSG in IDeaS

Room Types: All room types you wish to be subject to the IDeaS Daily BAR upload must be added.

Min Stay Through must = 1
Maximum stay through and all

other controls should be blank to allow IDeaS to control this rate code optimally using its decisions.

Maximum Advance Booking: Where applied this setting will minimize the number of days in the future that Opera can sell rooms on the rate plan. There are two options – your selection will depend upon your strategy for selling BAR rates beyond the 365 days of decisions provided by IDeaS:

- If you do wish to sell rooms beyond the 365 days of BAR values which IDeaS will define then this can be left blank and you can define values as far into the future as required (beyond 365 days) within the [Rate Detail tab > Daily Rates Entry](#). Alternatively you can set the maximum number of days into the future they wish to sell rooms for. Please note this setting will be constrained by the DAILY RATES MAX DAYS setting described above.
- If you do not wish to sell rooms beyond the 365 days of BAR values which IDeaS defines then this should be set to 364.

Room Types

All Room Types which should display during an F5 rate query process should be added to the Room Types field on the Rate Header Tab of the designated Daily BAR Rate Code. IDeaS RMS/PS will deliver a BAR value for each Room Type which is configured on the Daily BAR offsets sheet.

Please note that if a room type is not present in the Room Types field but is present on the offset sheet this will cause a decision upload failure.

Rate Header Components

Both boxes (BAR and Daily Rates) must be ticked on the designated Daily BAR rate code. These will only appear and be selectable if the correct functionality has been activated in the Application settings and parameters.

BAR Derivative Rates

This section covers the configuration required for rates which are derived from BAR in a way which is compatible with decision upload from IDEaS products.

With the BBAR functionality active this enables “BAR based” rate configuration within Opera products. There are several other types of rate derivative methodology. Please see below for an overview or refer to OPMS help files.

To Configure a Derivative Rate

There are several rate derivation types available on the Rates More tab in OPMS/ ORS Rate Configuration screens. This document covers some suggestions and considerations for the two main types: BAR Based and Base Rate.

BAR Based Derivation

During a rate query (e.g. within the F5 Rate Query screen), OPMS will check for the prevailing BAR Rate Code for the queried arrival date, LOS and room type. It then calculates and displays the price of that rate code, based on the criteria you just entered and the derivation rule applied on the BAR Based Rate Code.

For example, the BAR rate defined for the 23rd Dec 2015 is 100.00 for a Standard Double Room. The Consortia Rate is set as BAR Based with a discount of 10.00.

When the F5 Rate Query is run – the Consortia Rate will display as 90.00

It is recommended that this option is used where OPMS does not need to store and/ or distribute the values to another system i.e. where all rate queries are checking availability with the OPMS/ ORS Database directly and the derived rates are not sent on to third party systems or channels. This methodology prevents storage and performance concerns with the storage of derived rates and also presents the simplest option, particularly for BAR by LOS rate derivation.

Configuration Steps

Open the Configuration module from the Opera Login Page:

Navigate to: Configuration>Rate Management>Rate Classifications>Rate Codes

1. Configure the Rate Header as required

2. Click on the Rate More Tab:

3. Tick the BAR Based Box
 4. Enter the value in the amount box
 5. Select Amount or Percent in the drop down menu
 6. Apply rounding as required
 a. Example: BAR -10% (rounded to the nearest whole pound):

Please: repeat steps 1 to 6 until you have completed the configuration of all derivative rates.

Base Rate Derivation

When the **Rates>Base Rates** application function is active, a rate code may be derived from another rate code using Base Rate functionality:

The driving rate code is called the Base Rate and the rate codes which are derived from the Base Rate are known Dependent Rates.

Please note – when using the Base Rate functionality the Rate Details for dependent rates are stored in the OPMS/ ORS Database as values as opposed to being calculated live/ on the fly when a Rate Query is run (e.g. if the advanced purchase is BAR Based and is set to 10% discount from the prevailing BAR rate, then a full set of values by Rom Type are stored in the OPMS/ ORS Database as BAR – 10%).

For this reason no more than 75 rates can be derived from a single Base Rate code. There are also restrictions applied to Base Rates being Daily Rates rate codes due to the granularity of rate detail storage required. This methodology can represent a significant volume of derivative rates being stored for derivative rates.

Notes:

- ◆ **Compare with Rate Detail** functionality: if this function is ticked; where there are values on the Rate Detail – Opera will consider the values applied in the rate detail the maximum values for this rate code. If un-ticked no comparison is made with the rate detail.

- ◆ **Default to Highest BAR:** This setting will force BAR dependent rates to calculate their amount based on the highest BAR as opposed to defaulting to its own rate detail when all BAR rates are closed.
 - NB this will only display when **Rates>Default to Highest BAR** application parameter is active.
- ◆ **Dynamic Base rates** and **Advanced Dynamic Base Rates** operate similarly to BAR Base derived rates but they do not physically store rate details in the database. These types of derived rates can present alternative options to avoid storage or performance concerns.
- ◆ **Advanced Dynamic (BAR) Base Rate Functionality** can be used where the derivative rules are different for different room types and or seasons. This functionality would need to be activated and then the offset rules can be configured in the Rate Detail tab
- ◆ **Base Rate Extra Person Calculation application parameter** can be set to **N** if the Extra Adult and Extra Child values should not be subject to the derivative rate rules e.g. if the Extra Adult value is normally 20.00 and where a 10.00 discount is applied to a derivative rate you do not want the Extra Adult value to also be discounted by 10.00.
- ◆ It is recommended that all BAR derivative rate codes that you wish to display when you run a BAR Rate Query (F5) in OPMS are assigned to the “BAR” Opera Rate Category. This means that a Rate query will show the BAR price for Room Only, Bed & Breakfast, Dinner, Bed & Breakfast etc. when the BAR category is selected during the F5 Rate Query process
 - Example:

■

Rate Header	Rate Detail	Negotiated	More
Rate Code	BARBB	☐ ASB Rate	
Description	Best Available Rate Bed & Breakfast		
Rate Category	BAR		Rate Class PUB

■

Rate Header	Rate Detail	Negotiated	More
Rate Code	BARDB	☐ ASB Rate	
Description	Best Available Rate Dinner, Bed & Breakfast		
Rate Category	BAR		Rate Class

Configuration to Accept IDeaS Last Room Value (LRV)

This section covers the configuration required to support LRV uploads from IDeaS RMS in the form of an Opera Hurdle Value along with Delta, Ceiling and Maximum Rooms Sold values. All of these values are inputs into the Opera Yield Assessment Process.

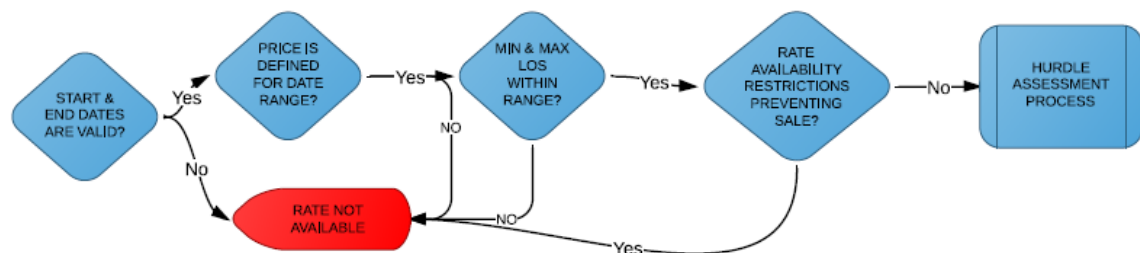

Please note: This control is relative to IDeaS RMS only, this control is not available when using IDeaS pricing system.

The LRV is a rate control which is designed to optimize the mix of business on a given date and prioritizes business based on the value of demand, by yielding products (rate code and room type combinations) based on their monetary value.

IDeaS RMS sends the LRV control to OPMS in the form of an Opera Hurdle Value along with a Delta, Ceiling & MaxSolds for each date in the IDeaS Forecast Window.

Rate Availability Check

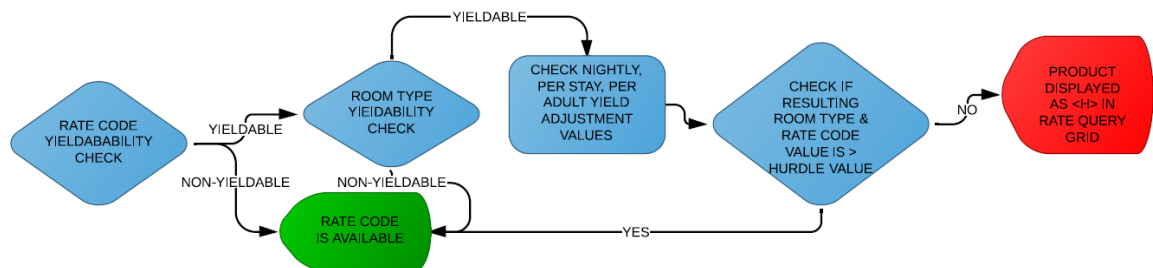

Opera PMS or CRS will check its own rate availability controls prior to evaluating any Opera Hurdle controls sent by IDeaS. The order of evaluation of controls in OPMS/ORS rate codes is as follows for the queried criteria (arrival date, LOS, occupancy level):

Opera Hurdle Assessment Process

Once the rate has passed a Rate Availability Check, the Opera Hurdle Assessment Process takes place to establish if a product should be made available for sale, depending upon its value.

The Opera Hurdle assessment process takes place as follows:

Please note: If “Yield As” functionality is in use then the assessment process will consider the value of the rate code which is selected within the “Yield as” field on the Rate Header configuration, rather than the Rate Code which is being sold. The Yield as functionality is explained in more detail below.

The function of each of the LRV associated controls is noted below relative to its function in OPMS/ORS. All of the values below are delivered to OPMS as part of the certified Opera integration:

- ◆ **Hurdle:** This is the value (currency amount) which is used to assess the minimum sale value of a product (Rate Code/Room Type combination) on the rate code. This is the value that the LRV from IDeaS becomes following the addition of tax (where appropriate)
- ◆ **Delta:** This represents a currency value which is added to the Opera Hurdle rate for each additional room sold from the time the Hurdle value was deployed in the PMS
- ◆ **Ceiling:** The maximum number of rooms sold to which the delta is added
- ◆ **MaxSold:** This value defines the maximum number of rooms which can be sold in the given Room Type. Calculation = Physical Capacity + Overbooking - Rooms Sold

Example

Opera Hurdle deployed at Business Day End (BDE) Optimization = 100 USD
Delta deployed at BDE = 10 USD
Ceiling = 3 Rooms

The first product sold must have a value of at least 100 USD
The second product must have a value of at least 110 USD
The third product must have a value of at least 120 USD
The fourth product must have a value of at least 130 USD

Thereafter all subsequent products sold must have a value of at least 130 USD until the Max Sold level is reached.

The count of incremental rooms sold (contributing to the ceiling and incremental increases in the Hurdle with additions of Delta value) is reset at the next optimization (either BDE (Business Day End) or CDP (Current Day processing)) with the Opera Hurdle value, Delta, Ceiling and MaxSold being updated post the RMS optimisation.

For further clarification on the calculation of the values which contribute to the selling system yield controls please see the relevant sections of the IDeaS help files below:

- ◆ [Calculating the Hurdle Rate](#)
- ◆ [Last Room Value Delta](#)
- ◆ [Maximum Rooms Sold](#)

Please note: Business Blocks (Group business) are not subject to the Opera Rate Hurdle check when they are blocked.

Note for IDeaS G3 RMS

IDeaS G3 RMS optimizes LRV decisions at the Room Class Level; therefore the hurdle and associated controls delivered to each room type will be relative to the Room Class to which the Room Type belongs. This means that a Yield category for each IDeaS G3 RMS Room Class should be created in Opera PMS.

If you are un-sure of your Opera Room Class configuration please refer to: **Configure > Room Class Configuration** in your IDeaS G3 RMS system.

A Yield Category should be created for each of the Room Classes in the menu on the left hand side.

System Parameters

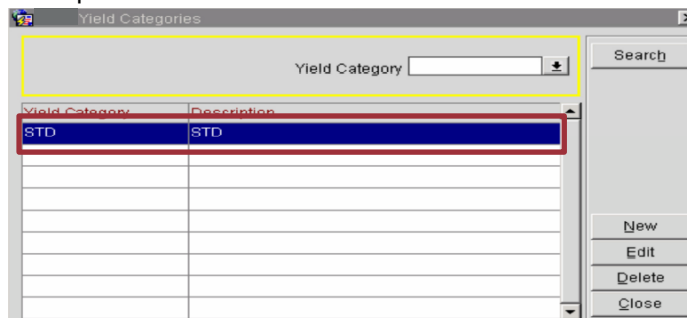

This section defines the system parameters which must be enabled to facilitate IDeaS LRV decision upload and use of the Hurdle Assessment within Opera products.

Open the Configuration module from the Opera Login Page:

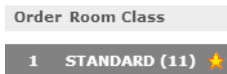

1. Navigate to: **Rate Management>Yield>Hurdle Rates**
 - a. This step serves as a check only; you will only have access to this menu once the appropriate Yield Management License is active in OPMS.
2. Navigate to: **Rate Management>Yield>Yield Categories**
 - a. The IDeaS - Opera Integration requires an Yield Category to be configured against each room type
3. In the **Yield Categories** Dialogue Box: Click on 
4. This step depends upon if you are working with IDeaS G2 or G3 Revenue Management System:
 - a. For **IDeaS Revenue Management System** create a Yield Category named “STD”

i. Example:

ii. Hurdles are delivered by Room Type to ensure appropriate distribution.

- b. For **IDeaS G3 Revenue Management System** create a Yield Category for each Room Class configured within: **Configure > Rooms Configuration**.

i. Example:

- ii. Based on this Room Class Configuration in IDEaS G3 RMS, 2 Yield Categories would be created:
 1. STANDARD
 2. SUITE
- iii. Please see note below regarding properties optimizing Component Rooms in G3 RMS.

Important Notes – Room Class Naming Convention Requirements

NB – There is a 10 Character Limit imposed on the Yield Category field in Opera and the characters must all be capitalized or numeric values with no spaces. This configuration must represent an exact match to the Room Class Field in IDEaS G3 RMS.

Please ensure that you verify the following conditions are met in IDEaS G3 RMS prior to beginning this configuration:

- ◆ Room Class names: Contain only capital letter characters or numbers
- ◆ Room Class names: Contain no more than 10 characters

Changes to Yield Categories

Please note – if you make changes to Room Type Inventory and Room Type to Room Class Mapping in G3 RMS which results in required changes to Yield Category configuration; Oracle Support recommend running an inventory resynchronization for at least one month forward from the current business date: This is performed within: **Utilities>Synchronize Utilities>Synchronize Inventory**.

Yield Adjustments

All rates are assessed by Opera PMS purely on the basis of their configured value in the Rate Detail Tab within the Rate Code. In some cases you may wish to adjust the yieldable value of a rate code to yield the rate code at a higher or lower value than the true configured sale price value in the Rate Detail tab.

An example of a use of this would be for rate codes which generate a high volume of revenue for other revenue streams but little accommodation revenue; Spa Packages & Golf Package Rates are a good example of this – the package may generate a high volume of Spa, Room Hire, Food and Beverage revenue but little accommodation revenue. In this example adjustment codes could be used to adjust the value at which the rate code is yielded.

Adjustment codes may be either positive or negative to allow the user to inflate or deflate the value at which the rate is yielded.

Creating Adjustment Codes

Open the Configuration module from the Login Page:

1. Navigate to: **Rate Management>Yield> Adjustment Codes**
2. Click A small grey rectangular button with the word "New" in black text.
3. Enter the details as required:

The screenshot shows a software window titled 'Yield Management Adjustment Codes'. It contains a table with five columns: Code, Description, Type, Amount, and Currency. An 'Adjustment Code - New' dialog box is overlaid on the table. This dialog box has input fields for 'Code', 'Description', 'Type' (a dropdown menu currently showing 'ST - Per Stay'), 'Amount', and 'Currency' (a dropdown menu with a small icon). At the bottom of the dialog are 'OK' and 'Close' buttons. Below the table in the main window are buttons for 'New', 'Edit', 'Delete', and 'Close'.

Code: A 4 character code of the user's choice which represents this adjustment code type e.g. SPA

Type: configures the method of calculation for the value e.g. per stay, per night, per person per night etc.

Amount: Positive or negative is the amount added to or subtracted from the rate value for the purposes of the yield value assessment.

4. The adjustment codes would then need to be added to the appropriate rate code(s) within the Rate Detail Tab.

Some Examples of Adjustment Codes

Code	Method of Calculation	Notes
SPA	Per person per stay	Spa Treatments: The value of the Spa treatments per person is added to the value of the yield assessment. This lets Opera know that the rate code is considered as higher than value than the rate code value.
LIM	Per Stay	Limousine Transfer: Fixed cost per stay is deducted from the value of the rate plan as this revenue is transferred to the service provider.
FRU	Per Night	Daily Fruit Basket in the room: this is a fixed cost per day which is attributed to the reservation
WIN	Per Person per Night	A glass of wine with dinner each night: This is a cost per adult per night which is deducted from the value of the reservation
BFK	Per Person per Night	Breakfast for each adult. This is a cost per adult per night which is not part of the normal accommodation revenue

Notes on using Yield Adjustments

- ◆ Yield rules are based on the value of a given rate loaded for each room type in the Rate Detail within the Rate Code configuration
 - » This means if you sell inclusive of TAX/VAT that the LRV should be offset to include TAX/VAT also to allow a direct and equal comparison. Please ensure you discuss this with your IDeaS contact if this is relevant for your hotel. Yield adjustments are not required for VAT/TAX in Opera products unless the LRV is sent exclusive of TAX/VAT. Please ensure you discuss the configuration you require with your IDeaS contact prior to decision upload.
 - » Please note that even where the package element is included in the rate code configuration on the rate header in Opera this is not removed from the yield value assessment in Opera

- If the rate code includes packages e.g. If the value of BAR1BB is 500 EUR but 20EUR is breakfast revenue then this needs to be adjusted accordingly (i.e. a -20 per adult per night adjustment code).
- ◆ Yieldable costs to reduce the value at which a rate is yielded should be entered as negative figures (e.g. -10)
- ◆ Yieldable values to increase the value at which a rate is yielded should be entered as positive figures (e.g. 10)
- ◆ Once configured adjustments codes should be added to a rate code & room type combination as appropriate within the Rate Detail tab on the rate codes in the PMS. Please see the section below for full details.

Rate Code Configuration Introduction

As per the above each rate code will be checked for its yield status during the Opera Hurdle Rate Check process. In order to support this the Opera Rate Code header must be set to one of the following statuses:

- ◆ **Yieldable:** this setting sets a rate code as subject to the Opera Hurdle assessment process in Opera Products when a rate query is performed.
- ◆ **Non-Yieldable:** The rate is not subject to the Opera Hurdle assessment.

IDEaS recommends that:

- ◆ Rate codes which are used for Transient business, with the exception of any rate codes used purely for House Accounts (E.g. for Pseudo room accounting) are set to Yieldable.
- ◆ Rate codes used for LRA accounts should be set to “Yield As” the highest value BAR rate plan (in a Daily BAR set-up this would be “Yield As” the designated Daily BAR rate code).
- ◆ Rate codes in OPMS/ORS which are specifically for Groups & Allocation Blocks are set to Non-Yieldable.
 - » This is because when reservations are picked-up from a business block the availability is determined by the rooms on the business block alone and not the Rate Code Availability
 - » For this reason BAR rates cannot be assigned to a Business Block Header in Opera PMS.

Rate Code Configuration Steps

Open the Configuration module from the Login Page:

 A blue rectangular button with the word "Configuration" in white text.

Navigate to: Rate Management>Rate Classifications>Rate Codes

1. Open the **Rate Header** Tab of the first rate code which is valid and available for sale:

OPERA1 - Rate Setup - Edit

Yield

Yield Status: Yieldable

Yield As:

2. Under The **Yield** Box you should select the appropriate Yield Status
3. Repeat Steps 1 & 2 for all active Rate Codes as appropriate.

Notes

Yield As

This functionality in Opera products enables the rate code to take on the Yield controls which are applied to the rate code for which "Yield As" is selected for.

For example if the Last Room Availability rate code "LRA1" is set to "Yield As" the Rate Code: "DAILYBAR" which is the Designated Daily BAR rate code then the same Opera Hurdle rate controls applied to the prevailing BAR Rate Code will be applied to rate code LRA1.

The same could apply in a BAR by LOS format - the LRA1 rate code could simply be set to "Yield As" the highest BAR rate in the BAR spectrum e.g. LRA 1 could be "Yield As" "BAR1".

Stay Pattern Controlled

This yield status is not recommended for use with the IDEaS interface as this yield status configured on Opera products means that the rate code will be subject to open/close controls by LOS delivered by the RMS, but will not be subject to any additional control from the Opera Hurdle value controls.

Room Type Configuration Parameters

As per the Opera Hurdle Assessment Process – Opera products check the yield status of both the Rate Code and the Room Type relative to the details entered in the Rate Query. Both items must be yieldable to be subject to the Hurdle value as part of the rate query process.

Recommendations

- ◆ IDeaS recommends that all room types which are part of the hotel's physical bedroom inventory should be set to Yieldable.
- ◆ Pseudo rooms (e.g. PS or PM) used for Pay Master reservations for example which are not part of physical availability should be set to Non-Yieldable.
- ◆ If you are using Opera Version 5.0.03.03 please contact your IDeaS representative to discuss your configuration further.

Configuration Steps – IDeaS Revenue Management System

Open the Configuration module from the Login Page:

Configuration

Navigate to: **Reservations > Room Classifications > Room Types**

1. Edit each room type as appropriate

2. Under the Yield box select the appropriate Yield Status for each room type
 - a. For **IDeaS Revenue Management System**: the STD category you created earlier should be added to all yieldable room types
 - b. For **IDeaS G3 Revenue Management System**: attach the appropriate Room Class as per the mapping between Room Types and Room Classes in IDeaS G3 RMS – for example, if the Room Class called “SUITE” in IDeaS G3 RMS contains two Room Types “SUSU” and “SUEX”; then “Suite” should be assigned in the “Yield Categories” field for the SUSU and SUEX room types in Opera PMS.
 - i. Please see notes below regarding properties using Component Rooms in G3 RMS.
3. Repeat steps 1 and 2 until you have assigned the appropriate yield status and yield category to all room types.

Note for Properties Using Component Rooms

Since OPMS does not offer RMS' the ability to flex the Hurdle applied to Rooms within a Room Class (Yield Category), IDeaS will usually upload Hurdles at the Room Type level for properties with Component Rooms. This allows G3 RMS to protect the Sale of Physical Parts of a Component Room where demand for the more valuable Component Rooms is high.

If your property is uploading Hurdles at a Room Type Level from G3 RMS, where your property uses Component Rooms in OPMS and G3 RMS – please ensure that instead of creating a Yield Category per Room Class, that a Yield Category is created per Room Type and each Room Type is assigned to the Yield Category of the same name.

Configuration to Accept Overbooking

This section covers the configuration required to support Hotel & Room Type Overbooking uploads from IDeaS products.

Note for IDeaS G3 RMS

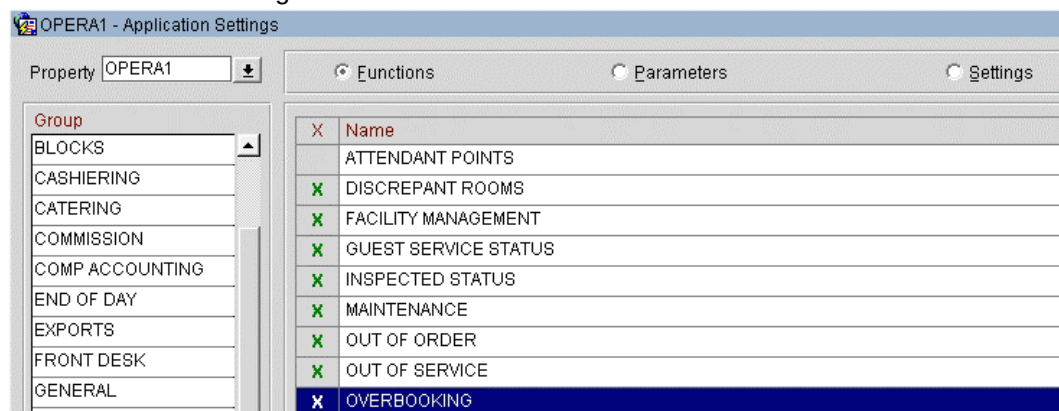

IDeaS G3 RMS optimizes LRV decisions at the Room Class Level (groups of similar room types); therefore the hurdle and associated controls delivered to each room type will be relative to the Room Class to which the Room Type belongs. As per OPMS' design: No overbooking decisions are sent for Component Room Types.

System Parameters

In order to work with the overbooking decisions in OPMS you must first activate the overbooking application setting.

Within the Opera PMS module please navigate To: **Settings > Application Settings > Functions> Rooms Management>Overbooking**

- ◆ Please ensure the Overbooking function is active
 - » You will see a green **X** next to the Function where it is active:

- ◆ If you do not see this please click **Edit** and change the Value to Y:

Value

Configuration for Yield Currency

This section covers the configuration required to support Yield Currency Conversion functionality within IDeaS products. Please note that this configuration is only required for clients using multi-currency environments and may not be applicable to you. Please consult with your IDeaS contact if you are un-sure.

Introduction to Yield Currency

This section is only for properties who use multiple currencies within their PMS/ORS systems e.g. where the base currency in the PMS is different to the sales currency, or where the sales currency in ORS differs from the sales currency in the PMS. Currency exchange will be required to transform the values to and from the Yield currency in use in IDeaS RMS.

Minimum Version Requirements

It is strongly recommended that OPMS & ORS Version 5.0.03.01 is adopted as a minimum due to an issue with revenue exports for business blocks which are not picked-up in prior versions. If you are using V 5.0.03.03 please ensure you discuss this with your IDeaS representative.

Working with IDeaS Yield Currency

For properties working in multiple currencies IDeaS interface is able to extract data containing:

- ◆ Hotel Base Currency Code
- ◆ Yield Currency Code
- ◆ Exchange Rates configured in Opera

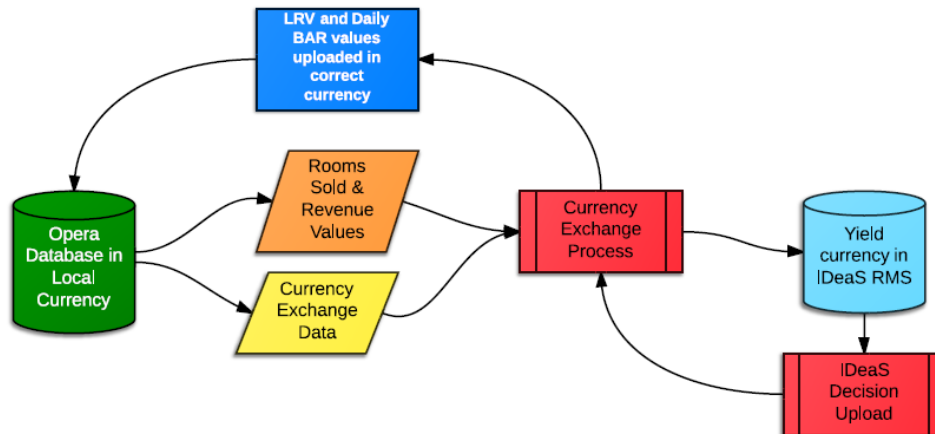

This data is available to IDeaS RMS where the full IDeaS license is purchased from Micros.

Data Conversion Process

The Micros API allows IDeaS to extract the user-defined exchange rate information to facilitate the adjustment of revenue and/or decision values.

Please note that where the decision upload currency differs from the PMS base currency – a separate subscriber is required to convert the decisions where you are working with Daily BAR decisions.

This data is simply collected from Opera, all conversion and calculation occurs within IDeaS subscriber software. The process is outlined in the diagram below:

Configuration Steps

- ◆ The currency exchange rates are entered into Opera in the **Exchange Rates Function**
 - » **Cashier>Cashier Functions> Exchange Rates**
 - » Please note that the Application setting: **Settings > Application Settings > Function> Cashiering>Foreign Currency Handling** must be active
 - » The currency exchange type defined as “Post” is used by the subscriber software in the Opera extract.
 - » It is important that the currency exchange type is set-up correctly – this can be defined as either >1 or <1. When setting up the exchange rate it is important to remember that the defined value will be configured as the volume of base currency required to buy a single unit of yield currency
 - Example: If the yield currency in use is USD and 1 USD will buy 0.75 Euros (EUR) then the currency exchange for EUR should be configured as 0.75
- ◆ To allow the conversion of rate codes in the F5 sales query screen the following application setting must also be active: **Settings > Application Settings > Parameters > Selling Screen > Convert Currencies in Grid**. This will produce the Currency Field in the top right of the F5 Rate Query Details screen:

DOCUMENT - Rate Query Details

Monday, January 02, 2006, 1 Nights, 1 Rooms, 1 Adults, 0 Children

Yield

Yield Status: Yieldable

Yield As:

The currency code must also be set correctly on the Rate Code header

IDEaS Configuration Considerations

The items below are important considerations when setting-up your IDEaS RMS system if you are using Yield Currency.

Please ensure the following parameters are configured relative to the yield currency in use:

- ◆ **G2 RMS Only:** Currency Code in System Tools > Setup > Property Configuration
- ◆ Group Rates/ Minimum Acceptable Rates in Group Pricing Configuration
- ◆ BAR Rate Plan Values

- ◆ Restriction Level Values/ Qualified Rate Values
- ◆ Cost of Walk

Past data may also need to be adjusted prior to installing Yield Currency functionality.
Please discuss this with your IDeaS CRM/CPM.
